On the Horizon - EPICS
R3.16

Jeff Hill
On the Horizon – EPICS R3.16

- R3.14 is done
- R3.15 is in progress
- R3.16 - our horizon
  - Scheduled functionality
  - Bonus functionality
Scheduled Functionality

- Transition to one CA server code base
- Upgrade Portable Server API
- Portable Server thread safety audit
- Portable Server thread scheduling
Transition to one CA server code base

- Currently we are maintaining two servers
  - Original server in iocCore
  - Portable CA server
- Moving to one server code base will drastically reduce the maintenance work load and increase upgrade efficiency
Upgrade Portable Server API

- Data Access HTML documentation
- Replace GDD with Data Access Interface
Portable Server Thread Safety Audit

- iocCore database must run in an independent thread
  - post events at a higher priority than the server
- Portable server integrates poorly with multi-threaded code unless we can certify it to be thread safe
Portable Server Thread Scheduling

- Portable server is currently select() scheduled
  - Support only thread scheduling in the future
  - Simplified design (my opinion)
  - Simplified debugging
  - Improved throughput and efficiency
  - Lower latency
We probably wont finish all of these but we’d like to

- Client API Enhancements
- Message Passing
- Generalized array data
- WAN Transparency
- Enhanced Subscription Update Triggering
- Virtual Circuit Enhancements
Client API Enhancements

- New next generation client API
  - Use of Data Access
- Server plug-ins can be accessed directly within client processes via procedure calls
- Simplified interface
- Original interface maintained for backward compatibility
Message Passing

- User defined types
  - Atomic updates of multiple parameters
  - Command completion notification
- Application expands set of named attributes
  - units, limits, process-passive, mesons per sec, etc
Generalized Array Data

- Client discovers N dimensional bounds of data
- Client addresses any hyper cube within bounds
- Eliminate string size limits
- Improved memory management for arrays
Enhanced Subscription Update
Triggering

- New subscription dispatching mechanisms
  - Time based triggering
    - Maximum period
    - Minimum period
    - Fixed period
  - PV event triggered
    - Download simple trigger expression into the server
      - Possibly follow the example of the CALC record
  - Client specified event queue length
WAN Transparency

- Directory services
  - Wildcard queries
  - Resource location monitoring
  - Detection of name space collisions during resource installation
  - Simplified configuration
  - Is LDAP the solution?
- IP multicasting
Virtual Circuit Enhancements

- Client specified priorities translated into IP circuit priorities
- Strengthened security (SSH, SSL, Kerberos etc)
Conclusions

- R3.14 is done
- R3.15 is nearly complete
- R3.16 – on our horizon
