

Command Line Tools for EPICS Base

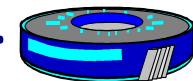

Ralph Lange

BESSY, Berlin, Germany

- Every site has a set of essential Channel Access command line tools.
- Most sites even have multiple versions (up to four) with slightly different features.
- These versions are of course incompatible, tests that rely on one version break with the others.

Include a minimal set of command line tools into EPICS base:

<code>caget</code>	get PV value
<code>caput</code>	put PV value
<code>camonitor</code>	set up CA monitor
<code>cainfo</code>	get meta information

These will be statically linked and are meant as debugging tools only – using them in scripts is ***not*** advisable.
