

# **Visual DCT / Upgrade**

Ivo List, Matej Sekoranja, Rok Sabjan

EPICS Meeting – Santa Fe, May 6, 2004

## Outline

- History & Functionality
- Hierarchies
- JCA Debug Plugin - Live Mode
- VDCT Package D
- Future plans
- Conclusion

## Visual DCT - Overview

- Very popular visual database configuration tool written by Cosylab.
- Original idea by Steve Hunt (SLS)
- Open source
- Funding by many labs: SLS, APS, DLS, SNS, JLAB
- Main features:
  - Written in Java
  - Extendable - plugins
  - Stores graphical information as comments
  - Reads also databases without graphical info
  - Easy to learn

**ao**  
**\$(NAME):wavelength**  
 DESC=signal wavelength  
 EGU=sec  
 VAL=1  
 PINI=YES  
 HOPR=10

SDIS	
DISS	<none>
PRIO	<none>
GUI_ALARMS	GUI_ALARMS
ACKT	YES*
GUI_BITS1	GUI_BITS1
ZRVL	0
ONVL	1
TWVL	2
ZRST	Off
ONST	On

Comment  
 Here is some comment

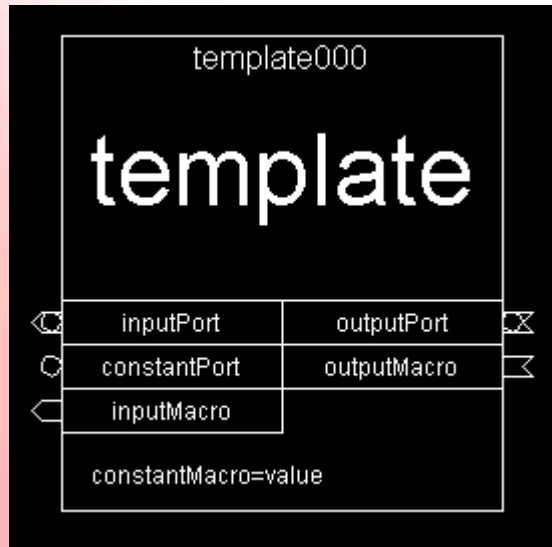

Frozen

## EPICS Hierarchies

- 2 types of files
  - templates
  - substitution files
- Macros passed only downwards
  - connection between different templates done in .subs files
  - no graphical editor for substitution files
- Will probably be made in one of the next EPICS core releases (maybe 3.15)
- Allowing two-way communication among templates of different hierarchical order
- “Data Encapsulation”
- Similar to OOP
- Current EPICS versions are unable to load these databases – database flattening

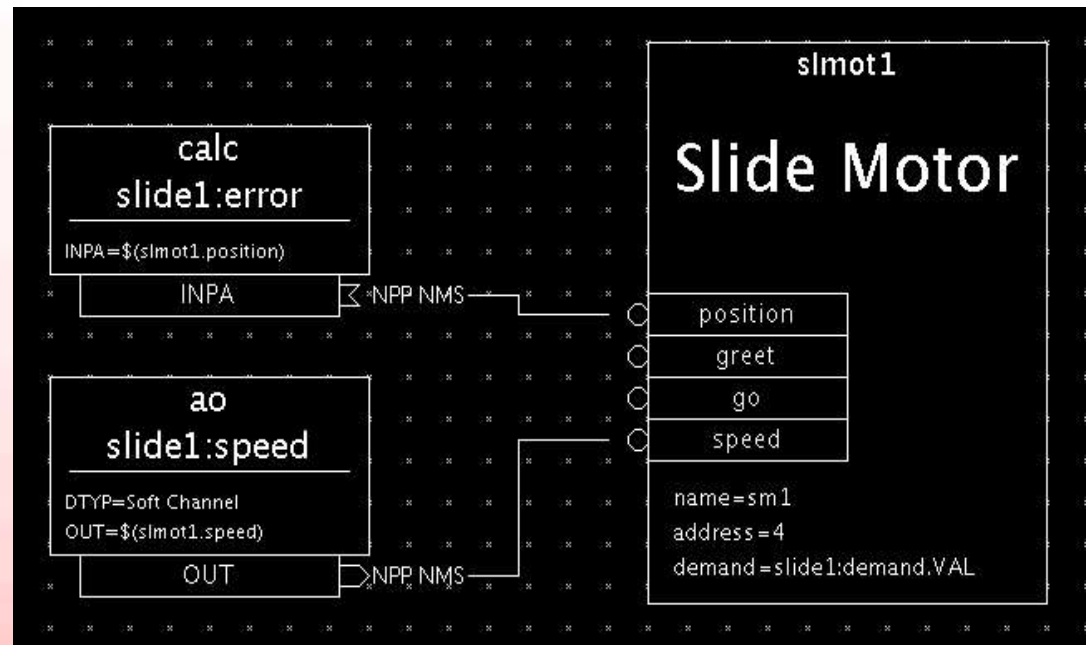

# Everything already works with Visual DCT!

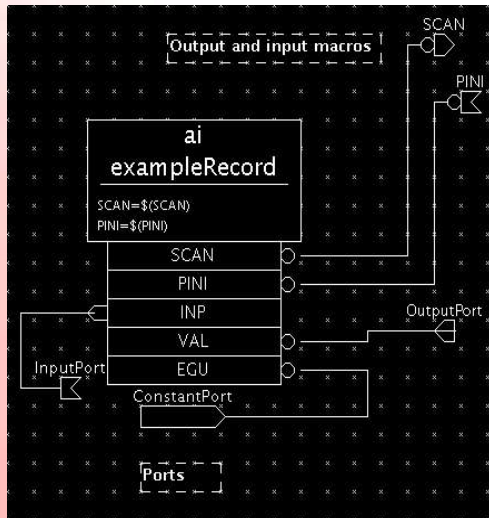

- One template block hides a database of arbitrary complexity!
- All that is seen are the ports and macros (input/output parameters)

- Connect the template into your database!
- Enter the instantiated template by SHIFT+click

## Lower level file

- All macros and ports can be created with a mouse click
- Input/Output/Constant attributes serve for better readability

## Database Flattening Tool

- Integral part of Visual DCT
- Product is a flat EPICS db file.
- All flattening tools should use comments that would refer blocks of code to the original files.
- Two passes (port names may be used before they are defined in the database).

Macros can be generated from all different occurrences of  $\$( )$

## JCA Debug Plugin (1 / 2)

- Enable "live mode" - view real PV values in your template
- Macros are obtained when a substitution file is provided
- Value is displayed inside the template instance symbol together with its timestamp
- Fields to be displayed are selected with the inspector
- Uses JCA 1.0
  - Needs also the native CA lib
  - Plan to migrate to pure Java CA implementation

The screenshot displays the JCA Debug Plugin interface. On the right, a template instance for 'ao' is shown with the following content:

```
ao
slide1:speed
-----
0.200
07:50:56.576
OUT=sm1:speed.VAL NPP NMS
OUT
```

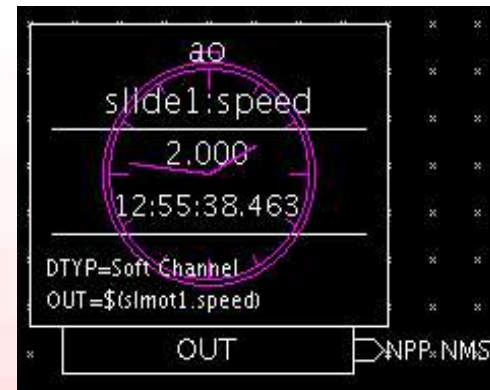

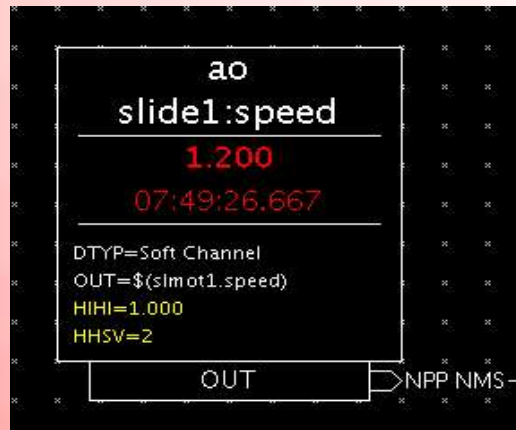

On the left, the 'Inspector - s' window shows the configuration for the 'slide1:speed (ao)' instance. The 'Value' field is set to 'GUI\_COMMON'. The 'DTYP' field is set to 'Soft Channel'. The 'VAL' field is set to '0.200'. The 'OUT' field is set to 'sm1:speed.VAL NP...'. The 'Comment' field is empty. The 'Frozen' checkbox is unchecked.

Group	Alphabetic
Value	GUI_COMMON
DESC	
ASG	
GUI_LINKS	
DTYP	Soft Channel
FLNK	
GUI_INPUTS	
SIOL	
SIML	
SIMS	<none>
GUI_OUTPUT	
OUT	sm1:speed.VAL NP...
VAL	0.200

## JCA Debug Plugin (2 / 2)

- Alarms are displayed with different colors
- Timeouts are indicated with a clock over the template instance symbol
- Change to another template instance (other substitution file line) on the fly

## Conversion Tools

- Thousands of DBs created using CapFast or GDCT are still used at various labs.
- There is a need for conversion tool that would convert also the graphical information (db layout)
- GDCT -> VDCT Converter was implemented by APS.
- CapFast -> VDCT Converter was implemented by Cosylab (sponsored by JLab), pay attention to the next presentation.

## Package D – Looking for Sponsor

- Some new nice features and bug fixes (only few are listed):
  - Morphing of record types
  - Meaningful template names (e.g. template000)
  - Macros do not work on template names
  - Local/global macro property
  - Command line DB flattening tool
  - Include statement
  - Links starting with digits are not constant link by default

## Coordinator for Visual DCT

- John Maclean (APS) has done a great job, but unfortunately no longer has time.
- SNS has offered to take the responsibility, to what we strongly applaud.
- There are quite some plans for future work:
  - Connection with other EPICS applications (Alarm Handler, Archiver...)
  - Use for EPICS IDE in combination with EPICS Express and JoiMint
  - Starting soft IOCs directly from Visual DCT
  - Installation of database from Visual DCT
  - Cosmetic changes and bug fixes

## Conclusion

- Visual DCT has become the most useful tool for database configuration and is widely used.
  - Hierarchies offer OOP like database configuration.
  - Use JCA Debug Plugin for live mode.
- Now is the time to reach for interoperability with other EPICS tools (IDE style).
- Download the latest build (2.4.1249) from <http://visualdct.cosylab.com>
- Test new feature of Visual DCT and report feedback (bug reports, wishlist):
  - Register at VDCT mailing list at <http://lists.cosylab.com>
  - Directly email main developer: [matej.sekoranja@cosylab.com](mailto:matej.sekoranja@cosylab.com)
